Internet Governance Principles

Internet has evolved over the course of the last decades due to the development of technology, the information society and communication. As a result enhance and maintain knowledge, and accept the multistakeholder model level of government, civil society, business and academia this net continuous to grow.

However with the development of the Internet, where it coexist public activity and private, the application of various principles is necessary. The principles that have different levels of management depending on the social and economic stage where countries are.

We believe that the principles of departure for the development of Internet should be already existing text, but we think that the following principles are those should deepen:

- The access to Internet: this principle includes the possibility to choose the software and the system, to warrant the digital inclusion, the neutrality and equality of the net.

- Freedom and equality in Internet: the persons have the right to be secure and trusted in the net, without ciberbullyng, grooming, identity theft, data protection, and others crimes. In addition to the crimes all the persons have the right to access a good services and protocols.

- Freedom of expression and information: this principle is basic to communication and evolves the persons through the net.

- Privacy of Internet: we need to develop this principle because this is a right that people have offline, and must also be protected online.

There are several principles that have been studied by large organizations such as the OECD, but we believe that these are to be further explored.
